12.6 Хеш файла без комментариев . . . 25

1 Настройка CLion

1. В файле `CMakeLists.txt` дописать строчку `add_compile_definitions(LOCAL)`. Нажать появившуюся опцию в правом верхнем углу `enable auto-reload`.

2. Вбить шаблон в `main.cpp`:

```
#ifdef LOCAL
#define _GLIBCXX_DEBUG
#endif
#include<bits/stdc++.h>

using namespace std;

#define int long long
#define app push_back
#define all(x) x.begin(), x.end()
#ifdef LOCAL
#define debug(...) [](auto...a){ ((cout << a <<
    ' '), ...) << endl; }(#__VA_ARGS__, ":",
    __VA_ARGS__)
#define debugv(v) do { cout << #v << ": "; for
    (auto x : v) cout << x << ' '; cout << endl
    ; } while(0)
#else
#define debug(...)
#define debugv(v)
#endif

int32_t main() {
  cin.tie(0);ios_base::sync_with_stdio(0);
  int n = 2; vector<int> a(n, n);
  debug(n); debugv(a);
}

//59124c
```

Скомпилировать, чтобы проверить отсутствие опечаток.

3. Запустить терминал (crtl + alt + T)

```
$ cd workspace/CLionProjects
$ for c in {A..Z}; do cp main.cpp $c.cpp &&
    echo "add_executable($c $c.cpp)" >>
    CMakeLists.txt; done
```

Далее отключаем подсветку и форматирование в настройках (ctrl+alt+S)

- Editor → Code Style → Formatter → `Do not format` прописать `*`
- Editor → Inspections → C/C++ → static analysis tools → CLang-Tidy отключить
- Editor → Inlay Hints → отключаем всё (достаточно первых трёх — code vision, parameter names, types).

Тёмная тема отключается в Appearance & Behavior → Appearance.

Чтобы добавить санитайзеры, надо дописать в CMakeLists.txt `set(CMAKE_CXX_FLAGS "-fsanitize=address -fsanitize=undefined")`

2 Теория чисел

2.1 КТО

```
int gcd(int a, int b, int &x, int &y) {
  if (b==0) { x = 1; y = 0; return a; }
  int d = gcd(b,a%b,y,x);
  y-=a/b*x;
  return d;
}
int inv(int r, int m) {
  int x, y;
  gcd(r,m,x,y);
  return (x+m)%m;
}
int crt(int r, int n, int c, int m) { return r + ((
    c - r) % m + m) * inv(n, m) % m * n; }

//8ed8ed
```

2.2 Алгоритм Миллера — Рабина

```
__int128 one=1;
int po(int a,int b,int p)
{
  int res=1;
  while(b) {if(b & 1) {res=(res*one*a)%p;--b;} else
     {a=(a*one*a)%p;b>>=1;}} return res;
}
bool chprime(int n) ///miller-rabin
{
  if(n==2) return true;
  if(n<=1 || n%2==0) return false;
  int h=n-1;int d=0;while(h%2==0) {h/=2;++d;}
  for(int a:{2, 3, 5, 7, 11, 13, 17, 19, 23, 29,
    31, 37})
    {
    if(a==n) return true;
    int u=po(a,h,n);bool ok=0;
    if(u%n==1) continue;
    for(int c=0;c<d;++c)
      {
      if((u+1)%n==0) {ok=1;break;}
      u=(u*one*u)%n;
    }
    if(!ok) return false;
  }
  return true;
}

//86b2ed
```

2.3 Алгоритм Берлекэмпа — Месси

https://mzhang2021.github.io/cp-blog/berlekamp-massey/

```
template<typename T>
vector<T> berlekampMassey(const vector<T> &s) {
  int n = s.size(), l = 0, m = 1;
  vector<T> b(n), c(n);
  T ld = b[0] = c[0] = 1;
  for (int i=0; i<n; i++, m++) {
    T d = s[i];
    for (int j=1; j<=l; j++)
      d += c[j] * s[i-j];
    if (d == 0) continue;
    vector<T> temp = c;
    T coef = d / ld;
    for (int j=m; j<n; j++) c[j] -= coef * b[j-m];
    if (2 * l <= i) {
      l = i + 1 - l;
      b = temp;
      ld = d;
      m = 0;
    }
  }
  c.resize(l + 1);
  c.erase(c.begin());
  for (T &x : c)
    x = -x;
  return c;
}

//ff47ae
```

2.4 Линейное решето

```
const int C = 1e7+7;
vi pr, lp(C);
for (int i = 2; i < C; ++i) {
  if (lp[i] == 0) {
    lp[i] = i;
    pr.app(i);
  }
  for (int j = 0; j < (int)pr.size() && pr[j] <= lp
    [i] && pr[j] * i < C; ++j) {
    lp[pr[j] * i] = pr[j];
  }
}

//36b3d1
```

2.5 Алгоритм Шенкса

```
#define T int
int mod;
int gcd(int a, int b, int &x, int &y) {
  if (b==0) { x = 1; y = 0; return a; }
  int d = gcd(b,a%b,y,x);
  y-=a/b*x;
  return d;
}
int inv(int r, int m) {
  int x, y;
  gcd(r,m,x,y);
  return (x+m)%m;
}
int crt(int r, int n, int c, int m) { return r + ((
    c - r) % m + m) * inv(n, m) % m * n; }
T inv(T a)
{
  return inv(a,mod);
}

//a75596
```

3 Графы

3.1 SCC и 2-SAT

Алгоритм ищет сильносвязные компоненты в графе g, если есть путь $i \to j$, то $scc[i] \le scc[j]$

```
vector<int> find_scc(vector<vector<int>> g) {
  int n = g.size();
  vector<vector<int>> r(n);
  for (int i = 0; i < n; ++i) {
    for (int j : g[i]) r[j].push_back(i);
  }
  vector<int> used(n), tout(n);
  int time = 0;
  auto dfs = [&](auto dfs, int cur) -> void {
    used[cur] = 1;
    for (int nxt : g[cur]) {
      if (!used[nxt]) dfs(dfs, nxt);
    }
    tout[cur] = time++;
  };
  for (int i = 0; i < n; ++i) if (!used[i]) dfs(dfs
    , i);
  vector<int> ind(n);
  iota(all(ind), 0);
  sort(all(ind), [&](int i, int j){return tout[i] >
     tout[j];});
  vector<int> scc(n, -1);
  auto go = [&](auto go, int cur, int color) ->
    void {
    scc[cur] = color;
    for (int nxt : r[cur]) {
      if (scc[nxt] == -1) go(go, nxt, color);
    }
  };
  int color = 0;
  for (int i : ind) {
    if (scc[i] == -1) go(go, i, color++);
  }
  return scc;
}

//4fd51f
```

Чтобы решать 2-SAT, надо создать граф на $2n$ вершинах, рёбра $i \Rightarrow j$ и $(j \oplus 1) \Rightarrow (i \oplus 1)$ должны быть добавлены одновременно. После этого если `scc[2 * i] = scc[2 * i + 1]`, то решения нет; если `scc[2 * i + 0] < scc[2 * i + 1]`, то присутствует импликация $\neg i \Rightarrow i$, надо назначить $i =$`true`.

3.2 Эйлеров цикл

```
vector<int> euler(vector<vector<pair<int, int>>> g,
     int m, int src) {  // g[cur][i] = pair{nxt,
    idx}
  int n = g.size();
  vector<int> used(m), it(n), cycle;
  auto dfs = [&](auto dfs, int cur) -> void {
    while (true) {
      while (it[cur] < g[cur].size() && used[g[cur
    ][it[cur]].second]) it[cur]++;
      if (it[cur] == g[cur].size()) return;
      auto [nxt, idx] = g[cur][it[cur]];
      used[idx] = true;
      dfs(dfs, nxt);
      cycle.push_back(idx); // or {cur, nxt}
    }
  };
  dfs(dfs, src);
  reverse(cycle.begin(), cycle.end());
  if (cycle.size() != m) return {}; // check that
    all edges are present in the cycle, fail
    otherwise
  return cycle;
}

//f6b9d4
```

3.3 Компоненты рёберной двусвязности

```
//n - number of vertices, m - number of edges,
    parallel edges -- ???, color of any edge is the
     color of its lower end
vector <vector <int> > dfstree(n);
vector <int> used(n), cut(n), h(n), up(n);
auto findCutPoints = [&] (auto self, int u) -> void
     {
    used[u] = 1;
    up[u] = h[u];
    for (int v : g[u]) {
        if (!used[v]) {
            dfstree[u].push_back(v);
            h[v] = h[u] + 1;
            self(self, v);
```

```
            up[u] = min(up[u], up[v]);
            if (up[v] >= h[u]) {
                cut[v] = 1;
            }
        }
        else {
            up[u] = min(up[u], h[v]);
        }
    }
};
findCutPoints(findCutPoints, 0);
vector <vector <int> > tree(n + m);
vector<int> color(n);color[0]=0;int ptr=n;
auto build = [&] (auto self, int u) -> void {
    for (int v : dfstree[u]) {
        if (cut[v]) {
            color[v]=ptr;++ptr;
            self(self, v);
        }
        else {
            color[v]=color[u];
            self(self, v);
        }
    }
};
build(build, 0);
for(int i=0;i<n;++i) {
    set<int> to;
    for(int j:g[i]) {
        int x=i,y=j;
        if(h[x]<h[y]) swap(x,y);
        to.insert(color[x]);
    }
    for(int j:to) {
        tree[i].app(j);tree[j].app(i);
    }
}

//2ebfbb
```

3.4 DCP offline

```

3.8 Алгоритм Чу-Лью

В ориентированном взвешенном графе ищет остовное дерево минимального веса (такое дерево, что все вершины достижимы из нуля, входящая степень любой ненулевой вершины равна 1, в нуль не входит ни одного ребра). Если `recover = true`, то восстанавливает ответ.

Предполагается, что все вершины достижимы из нуля.

12.5 Что сделать на пробном туре

- Послать клар
- Распечатать что-то
- Получить ML (stack & heap)
- Максимальный размер отправляемого файла?
- Убедиться, что чекер регистронезависимый (yes/YES)
- Позапускать Флойда — Варшалла
- Посмотреть, насколько быстр быстрый ввод
- Перебить что-то, проверить хеш
- Проверить санитайзеры

12.6 Хеш файла без комментариев

Хеш файла, игнорирующий переводы строк и комментарии:

```
$ cpp -dD -P -fpreprocessed "$filename" | tr -d '[:
    space:]' | md5sum | cut -c-6
```
